Javascript Project : BOOK LIBRARY

Create a small application that holds an inventory of your books and articles. Books have name, author, image , description and status, articles have name, author, image, description, status and a link to the website you found them on.

The page layout:

- On the left side, you have a menu that collapses and expands on click
- The menu shows all the books and articles arranged in alphabetical order of titles
- You also have a button for adding a book/article
- The books and articles are stored in local files
- The page has a way to select what do you want to see : books or articles ; read/unread books and read/unread articles
- For each book/article on the page you have the following details: image, name, author and a button
- The button opens a modal that shows all the information connected to that book and radio button that allows you to change the status from read to unread and viceversa
- In the modal you give the options to edit

All the http requests are made to local files using ajax.
